Post-yield, $L = 50$; irreversible population from ΔE_R split
irreversible data
global-min truncated power law
global minimum
ΔE_I
$p(\Delta E_I)$
$\Delta E_{\min}^{global} = 9.67e-03$
$\alpha = 0.79$, $\lambda = 4.78e-01$
$D = 0.028$, $n = 412$
ΔE_I
ΔE_R
$p(\Delta E_R)$
$\Delta E_{\min}^{global} = 1.05e-02$
$\alpha = 0.81$, $\lambda = 4.70e-01$
$D = 0.026$, $n = 466$
ΔE_R
ΔE_S
$p(\Delta E_S)$
$\Delta E_{\min}^{global} = 8.35e-03$
$\alpha = 0.81$, $\lambda = 4.70e-01$
$D = 0.026$, $n = 454$
ΔE_S
Post-yield, $L = 50$; ΔE_I irreversible
D
p = 0.10 threshold
Global D minimum: 9.67e-03
p-value
Exponent α
Inverse cutoff $1/\lambda$
$\Delta E_{I,\min}$
Post-yield, $L = 50$; ΔE_R irreversible
D
p = 0.10 threshold
Global D minimum: 1.05e-02
p-value
Exponent α
Inverse cutoff $1/\lambda$
$\Delta E_{R,\min}$
Post-yield, $L = 50$; ΔE_S irreversible
D
p = 0.10 threshold
Global D minimum: 8.35e-03
p-value
Exponent α
Inverse cutoff $1/\lambda$
$\Delta E_{S,\min}$
